---

Good morning to whom it concern

Upon all recent developments for the future of British Columbians and the development of clean renewable energy in a winter country .

We are the midst of developing one the last resources that can sustain such demand and still be very friendly to the environment as thirty so years of study has shown . Yes there are a lot of nay sayers saying this project is too costly or not needed , but that is a persons opinion which everyone is entitled to even myself as I present my opinion .

The nay sayers can not predict the future and the future demands of hydro electricity and most certainly won't know what the demand will be 100 years from now . This why to vision the future for our children and children's children is most important to do so today .

I have no personal business ties to this project and do not foresee any , so my ties to the project are strictly for the vision of the future , and stability of this highly valued resource of hydro electricity.  
Without this resource life in Canada during the long winter months would simply not exist.

With the cost put into the damm it would seem to be totally senseless to shut the project down and we would not be here even if the government did not change and can surely tell you it will be changing again here very soon .

Best regards
