I note from the forecast graphs, that the increase in electrical is suggested to be a steady increase across the board. However, I m of the opinion that the use of the electric vehicle will increase exponentially into the future. This will require a greater demand for electric power, and will most notably be during the evening hours when the sun has set, so solar will not be the right answer. And having seen the devastation from recent hurricanes, I have strong suspicions that wind towers would not hold up well if we are hit with the force of Mother Nature.

I am in support of continuing and completing this site C project. The fact that it has been on the drawing board for over 30 years, is enough notification for locals to know that this area has been designated a project. The development of a dam and 'lake', will be a beneficial addition to our tourism industry. The building of the Kooteney Dam 60 years ago has proven to be a constant funding source for our social services here in BC. Finally, the electric power generated by this dam is the cleanest form of energy I can think of, and it also will provide additional water reserves during the dry season.

Thanks for allowing me to comment
