This project should never have been approved. BC Hydro failed to demonstrate the need for a dam of that size in that location, except for the capacity to supply the vast amounts of water needed for private companies who wish to acquire natural gas by the destructive method known as "fracking". This unnecessary dam has already cost billions and destroyed valuable farmland, not to mention land sacred to the indigenous people, who were not adequately consulted. According to independent experts, stopping this project will be expensive, but continuing will be even more expensive ! We must cut our losses at this point and stop all further damage, both financial and environmental.
